VITAMIN D₃

- **the anti-cancer, anti-obesity, mood-boosting vitamin**
- **new research shows that vitamin D is one of the most important micronutrients to supplement with**

DID YOU KNOW?

- **50% of men and women are deficient in Vitamin D** because they are not exposed to adequate sunlight due to office-bound jobs, indoor lifestyles & the use of sunscreen which reduces Vitamin D production by more than 80%. In studies performed in countries with similar sunlight conditions to South Africa (Australia and New Zealand), the highest rates of deficiency occur in dark-skinned or pregnant women (80% deficiency)¹. The elderly had deficiency rates of 76%², whilst young adults were 23%-43% deficient¹.
- Vitamin D deficiency results in not only **osteoporosis**³, but also **cancer**⁴, **insulin resistance**⁵, **diabetes**⁶, **heart attacks**⁷, **depressed mood**⁸, and **obesity**⁹ (ever noticed how people who suntan regularly lose weight and feel great? –It's because of sunlight-induced Vitamin D production).
- Research published in August 2007 shows that **600 000 cases of cancer can be prevented EVERY YEAR** through regular preventative supplementation with Vitamin D⁴.
- A broken hip resulting from osteoporosis poses a greater risk of death than any type of cancer¹⁰. Vitamin D helps prevent both, especially if commenced from young adulthood and used regularly^{3,4}.
- Recent research shows that the previously recommended **400IU per day is 5 times too little**¹¹. **Optimal Vitamin D consumption should be 2000IU daily**¹¹.
- **The safest and most effective type of vitamin D is the D₃ form, not the D₁ or D₂ form**¹².

New from Solal Technologies, the first optimal dose Vitamin D₃.
